 View author addresses

Abstract

Urinary neoplasms refer to malignancies of the kidney, renal pelvis, ureter, bladder, and prostate, which are increasing yearly. Available molecular targeted therapies, molecular targeted therapies have demonstrated that cell pyroptosis is involved in urinary tumours. Pyroptosis is a form of programmed cell death mediated by gasdermins (GSDMs) and is characterized by cell swelling and membrane rupture. Recent studies have shown that pyroptosis plays a key role in the progression of urinary malignancies. This review discusses the role of pyroptosis in urinary malignancies and explores potential therapeutic targets.
